GENERAL INFORMATION:
APPLICANT: Ding, Jeak Ling
APPLICANT: Ho, Bow
TITLE OF INVENTION: The Cloned Factor C cDNA of the
TITLE OF INVENTION: Singapore Horseshoe Crab, Carcinoscorpius
TITLE OF INVENTION: rotundicauda and Purification of Factor C Proenzyme
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSE: B1rch, Stewart, Kolasch & Birch
STREET: 8110 Gatehouse Road, Suite 500 East
CITY: Falls Church
STATE: Virginia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-08-296-014A-2

     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       seq length:

1- FUNCTION: THIS RECEPTOR HAS ESSENTIAL ROLES IN THE REGULATION OF IGE PRODUCTION AND IN THE DIFFERENTIATION OF B-CELLS (IT IS A B-CELL-SPECIFIC ANTICEN).

1- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. ALSO EXISTS AS A SOLUBLE EXCRETED FORM.

A SOLUBLE EXCRETED FORM.

1- ALTERNATIVE PRODUCTS: 2 ISOPORMS; A (SHOWN HERE) AND B; ARE PRODUCED BY ALTERNATIVE SPLICING.

MISCELLANEOUS: THERE ARE TWO KINDS OF FC RECEPTORS FOR IGE, WHICH
DIFFER IN BOTH STRUCTURE AND FUNCTION: HIGH AFFINITY RECEPTORS ON
BASOPHILS AND MAST CELLS AND LOW AFFINITY RECEPTORS ON LYMPHOCYTES

CATALYTIC ACTIVITY: (7E,9E,112,142)-(5S,6S)-5,6-epoxyicosa-7,9,11.14-tetraenoate + H(2)O = (6Z,8E,10E,14Z)-(5S,12R)-5,12-dihydroxyicosa-6,8,10,14-tetraenoate.

COPACTOR: BINDS 1 ZINC ION (BY SIMILARITY).

PATHWAY: Leukottienes biosynthesis; third step.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nitted (JUL-1995) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Hydrolyzes an epoxide moiety of leukotriene A4 (LTA-4)
to form leukotriene B4 (LTB-4). The enzyme also has some peptida
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DIKSFKTQQI 205

submitted to the Brookhaven Protein Data Bank, November 1995

A;Reference number: A65963; PDB:IKIE

A;Contents: annotation; conformation by theoretical model, residues 173-285

C;Comment: The sequence of the splice form a is shown.

C;Comment: This receptor for the Fc portion of IgE is expressed in various hematopoietic elis.

C;Comment: Splice form a is expressed constitutively in B-cells; b is expressed in other C;Comment: Soluble IgE-binding factors are produced by proteolytic cleavage of IgE Fc re C;Comment: Soluble IgE-binding factors are produced by proteolytic cleavage of IgE Fc re C;Genetics:

A:Molecule type: protein
A:Residues: 24-49; L; 51-63 <KAT>
C:Comment: Three types of PAI have been identified. PAI-1
may be the primary site of synthesis of plasma PAI.
C:Comment: This inhibitor acts as "bait" for tissue plasmi
                                                                                                                                                                                                                                                                                                                                                                                                                                                    A;Molecule type: mRNA

In large quantities. The DNA encoding the protein is obtd. from, eg human B cells, human malignant B or T cells, human monocytes or human eosinophilic cells. RPMI 8866 cells may also be cultured to produce the mRNA. The IgE binding factor and Fc epsilon receptor binds IgE and can be used to enhance the prodn. of IgE from IgE producing cells. They can be used to treat allergies by eliminating excess blood IgE, and can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 6; page 42-3; 57pp; English.

 Human IgE binding factor related polypeptide
                      12-DEC-1990
                                                                                                                                                                                                                     Fc epsilon receptor binds IgE. It is expressed from cell line RPMI8866. It is expressed in large ants, and can be used to remove excess IgE from blood, and to detect and quantify IgE. This would allow the development of therapy and diagnosis of allergy.

                                                                                                                                                                                                                                                                                                                                                                                     The peptide is related to the IgE receptors on human B-cells and, if without the membrane anchoring sequence, to the IgE-BFs of Sarfati et al. Immunology 53, 197, 207, 783 (1984).

Amino acids between 1-133 starting from the N-terminal may be deleted. This is the membrane-anchoring sequence binding the polypeptide to the cytoplasmic membrane of the B-cells.

Alternatively amino acids between 110-130 or 250-321 may also be deleted. The peptide has IgE binding activity and is useful tor treating allergic conditions, e.g. as caused by antigens such as pollens, cat danders and house dust mites.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preparing FCR. Preferred embodiments of the present invention are psfc-epsilon-R-1 (see AAN81516/P81175) and also AAP81172. At least a part of the cDNA SQ coding for the AAS 1 to 148 of the FC-epsilon-R is replaced by a eucaryotic cDNA signal SQ e.g.an interleukin cDNA signal SQ e.g.by the BSF-2 signal SQ (see pBSF-2-L8-AAN81517/P81176). A suitable yeast expression vector is a plasmid contg. the yeast ADHI-promoter, a gene coding for the yeast mating factor alpha leader peptide (MF alpha leader SQ) a multicloning site and the yeast ADHI-terminator (see AAN81514/P81173). See also EP-258492.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The inventors claim a human low affinity Fc-epsilon-receptor (FCR) with an N-terminal cytoplasmic domain, a C-terminal extracellular domain and a mol.w. of about 46kd. Also claimed are recombinant DNA conty, the genetic information for the FCR, vectors conty, the DNA, host organisms transformed with the vectors, oligonucleotides coding for partial amino acid sequences from FCR, and processes for
                                                                                                                                                                                                                        Human lymphocyte receptor

AAN90344). Used to produce highly bioactive water-soluble FCR. Water-soluble FCR binds IgE, so it is useful for treating hypersensitivity, esp. asthma. Amino acid residue 150 is a possible site for trypsin-like proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Soluble recombinant Fc-epsilon receptor - used for treatment or prophylaxis of local and allergic reactions induced by IgE.
                                                                                                                                 Cloned genes coding for soluble IgE receptor coding sequence of Fc epsilon receptor gene.
                                                                                                                                                            WPI; 1989-186101/26.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is of IgE-binding factor, secreted from the plasmid pSVG-BF. The plasmid pSVG-BF is a derivative of plasmid pSVG-ER which has the sequence coding amino acids 1-147 replaced with a coding region (AAQ55400) allowing secretion of the factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant DNA molecule - comprises enhancer and promoter unit
linked to transcriptive DNA segment and DNA segment comprising
promoter unit linked to DNA sub-segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key
